

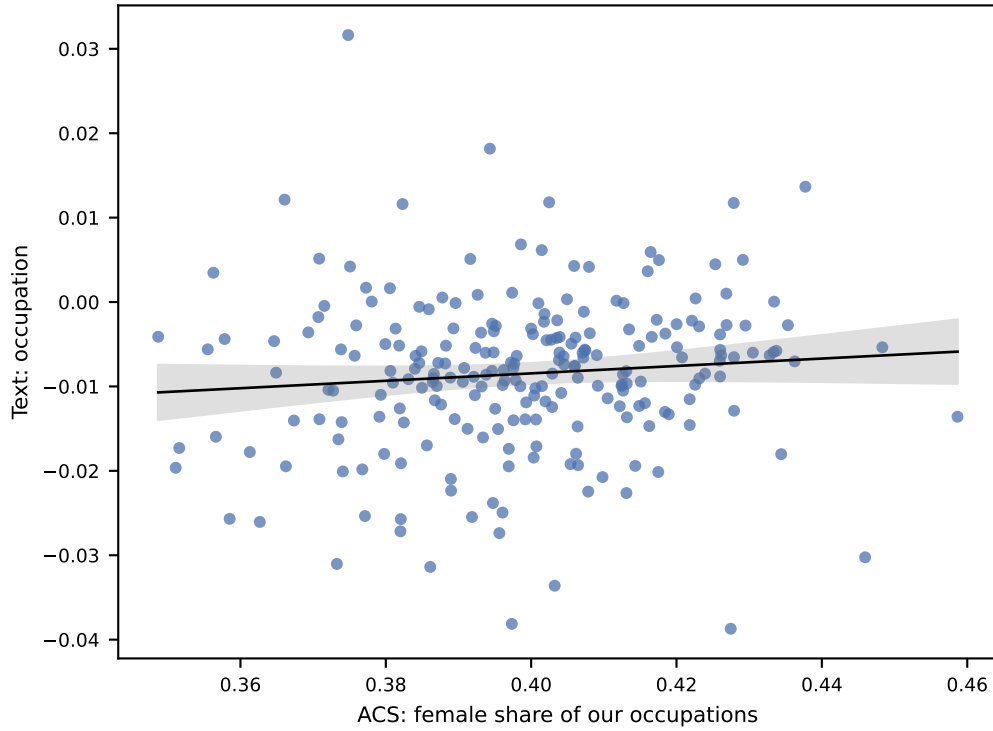

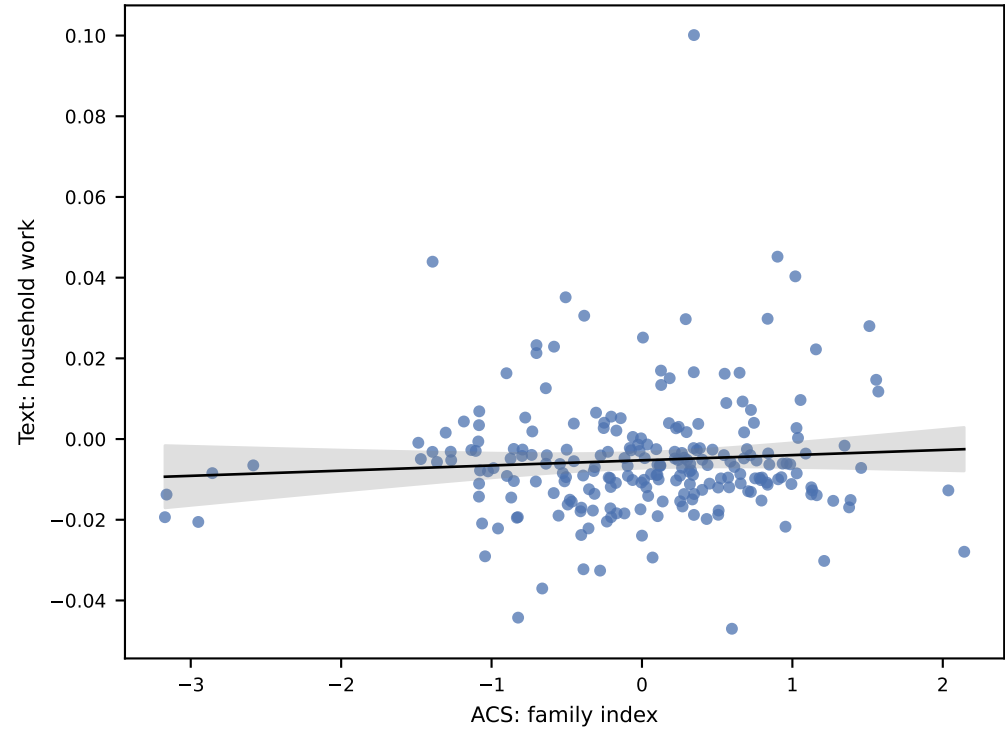

Figure 2. Does the text score agree with the survey? (higher = less traditional)

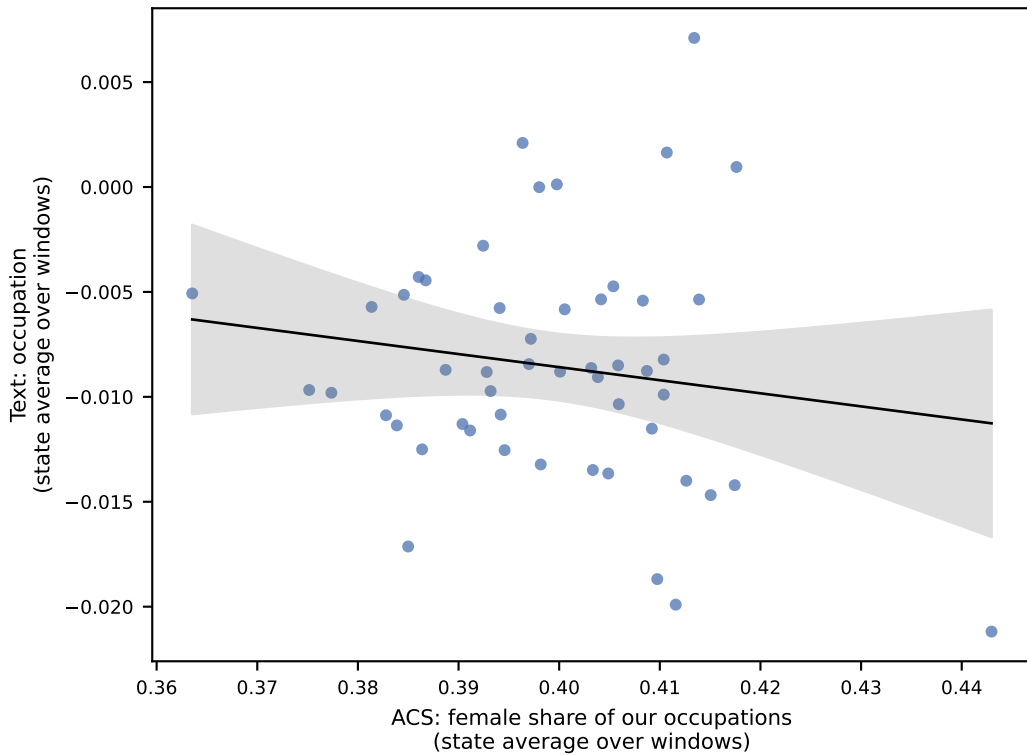

A. occupation: one point = one state in one window
 $r = 0.09$ ($p = 0.152$), $n = 232$

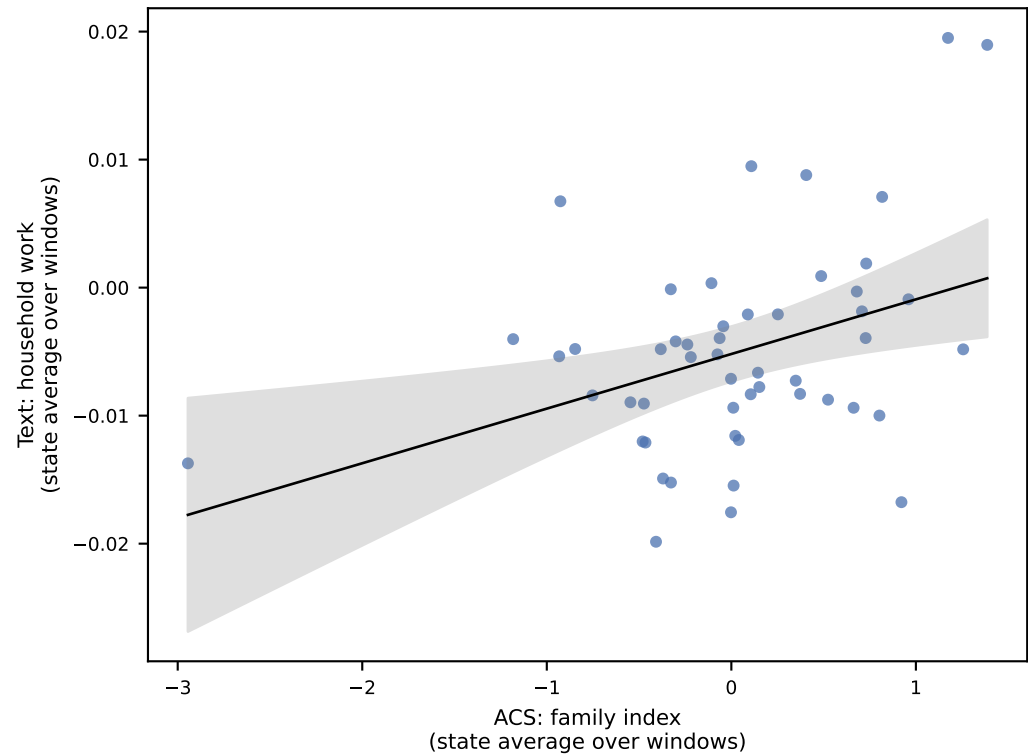

B. household: one point = one state in one window
 $r = 0.07$ ($p = 0.284$), $n = 228$

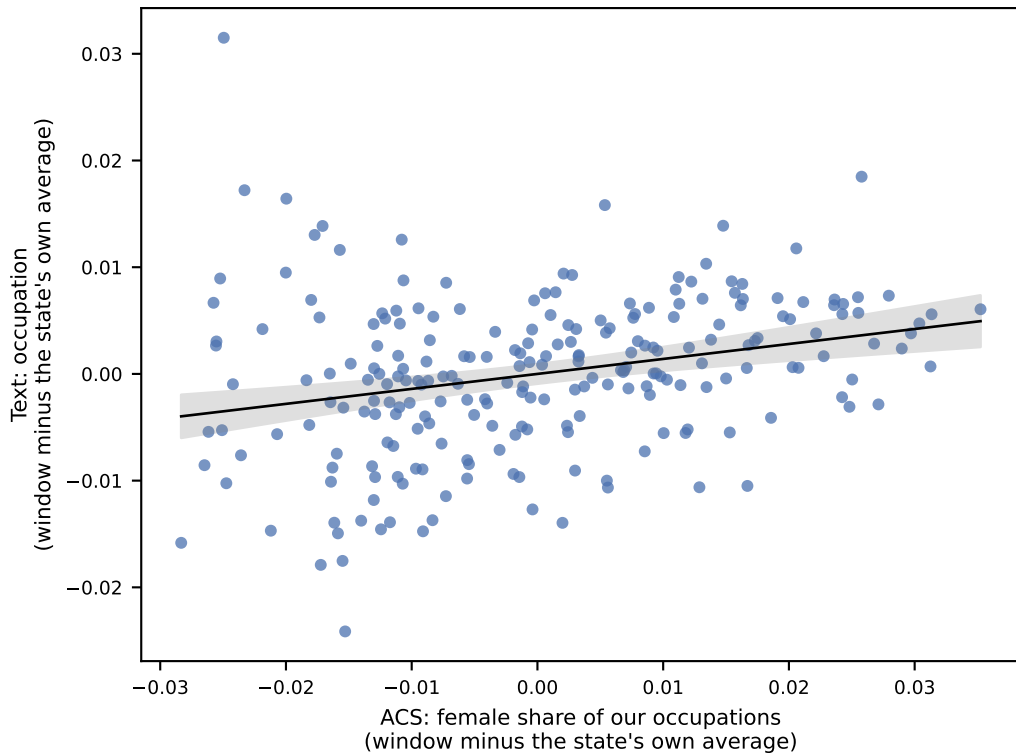

C. occupation, between states: one point = one state
 $r = -0.15$ ($p = 0.295$), $n = 51$

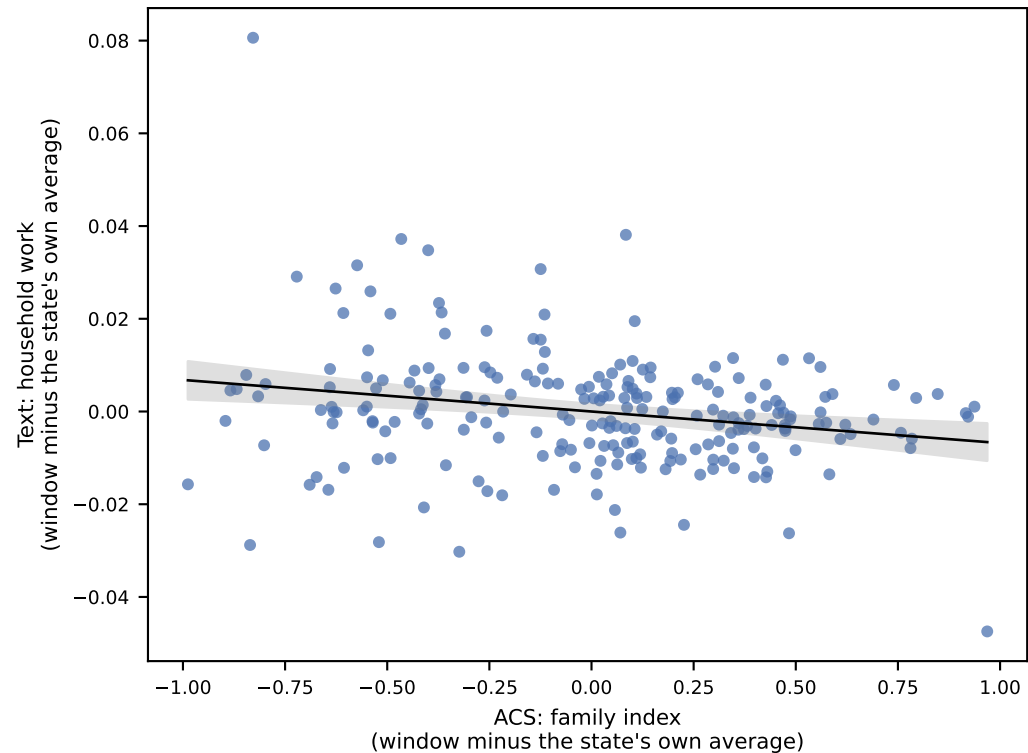

D. household, between states: one point = one state
 $r = 0.38$ ($p = 0.006$), $n = 51$

E. occupation, within states: one point = one state-window
 $r = 0.28$ ($p = 0.000$), $n = 232$

F. household, within states: one point = one state-window
 $r = -0.23$ ($p = 0.001$), $n = 228$

C, D: are states that are less traditional in the survey also less traditional in text?
 E, F: when a state moves between windows in the survey, does its text move the same way? $r > 0$ = agreement.
