

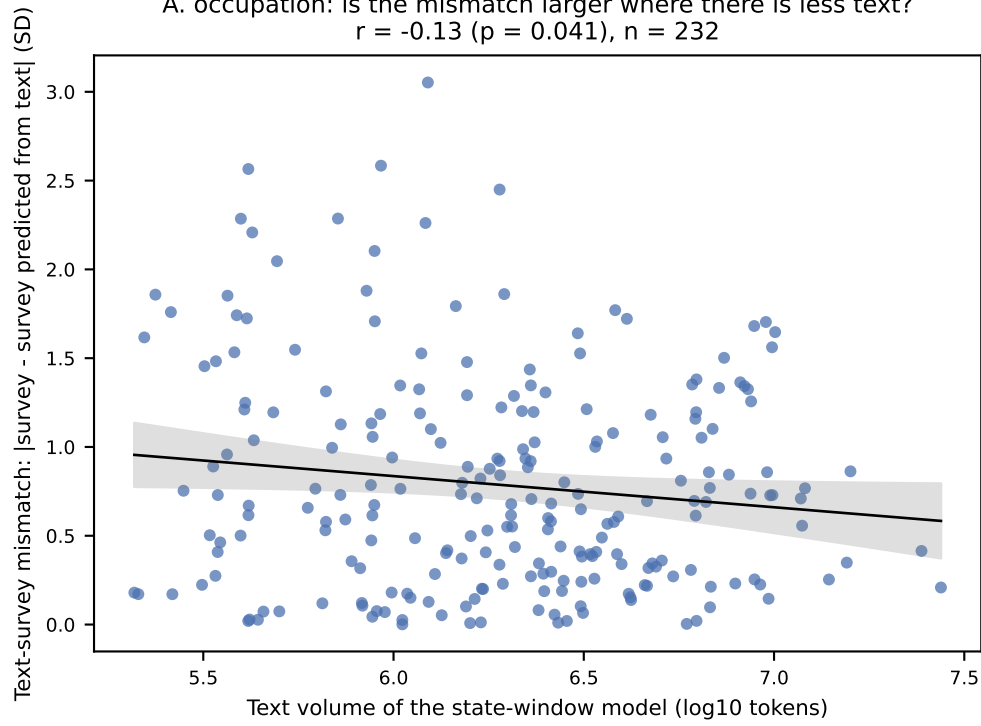

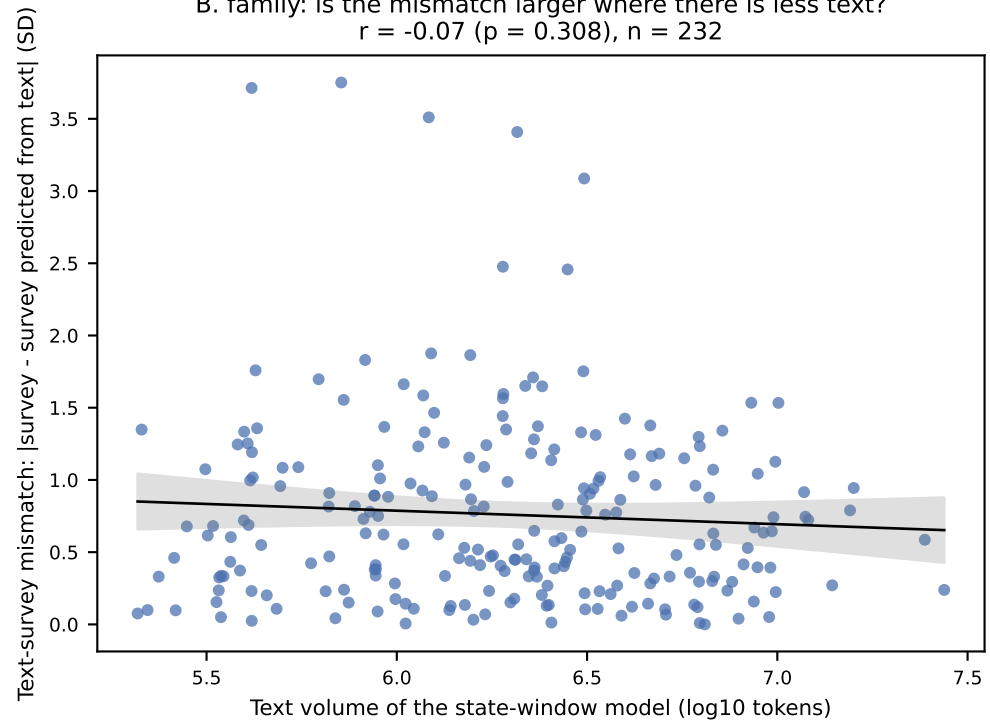

Figure 3. Measurement reliability

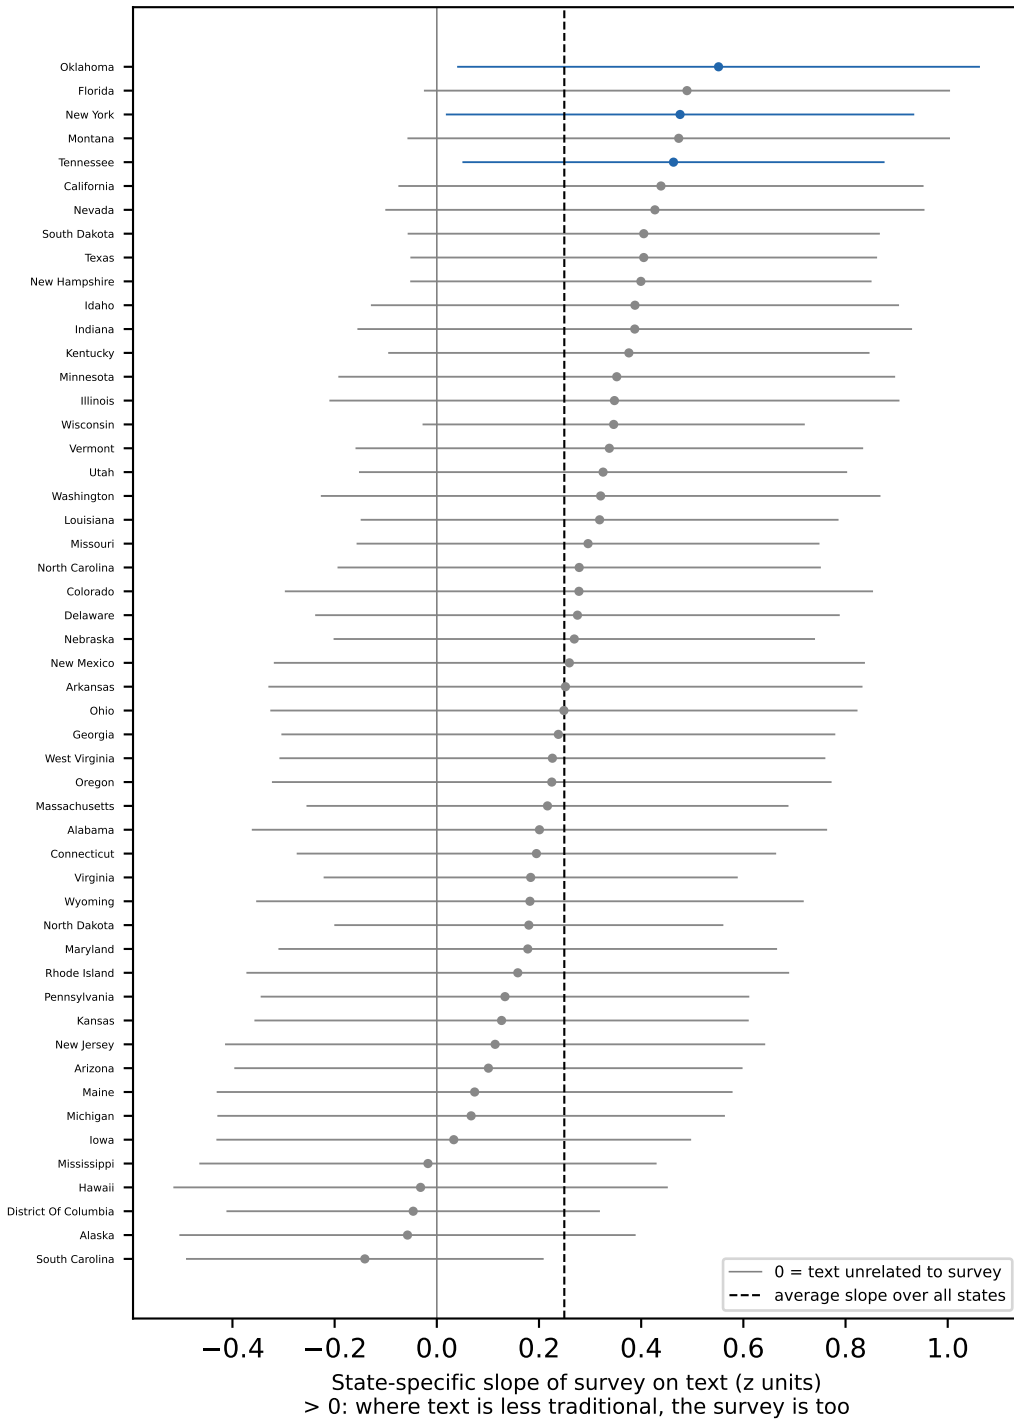

A. occupation: is the mismatch larger where there is less text?
 $r = -0.13$ ($p = 0.041$), $n = 232$

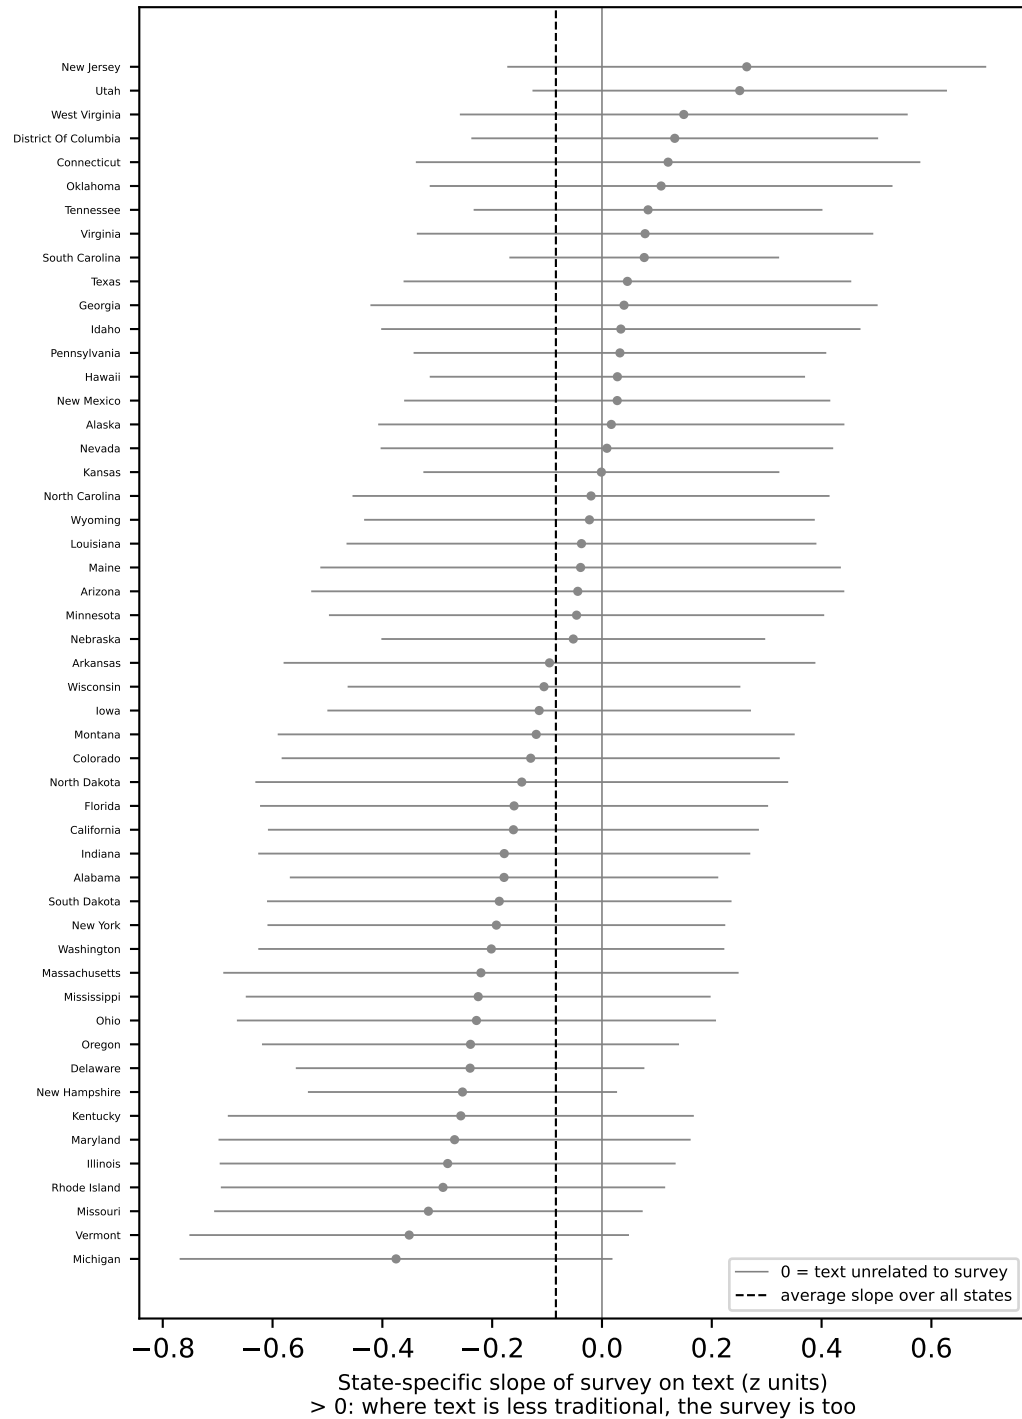

B. family: is the mismatch larger where there is less text?
 $r = -0.07$ ($p = 0.308$), $n = 232$

C. occupation: how closely does text track the survey in each state?

D. family: how closely does text track the survey in each state?

C, D: one hierarchical model, slopes partially pooled toward the average; bars = 95% intervals (blue > 0 , red < 0 , grey includes 0).
 Each state has at most 5 windows, so most intervals include 0.
