

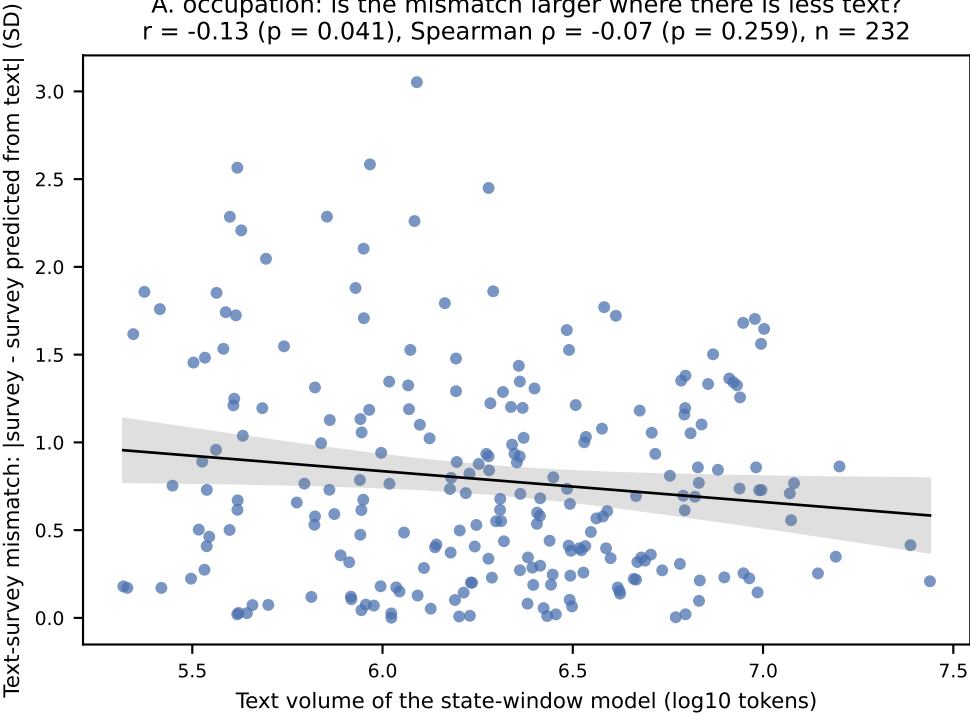

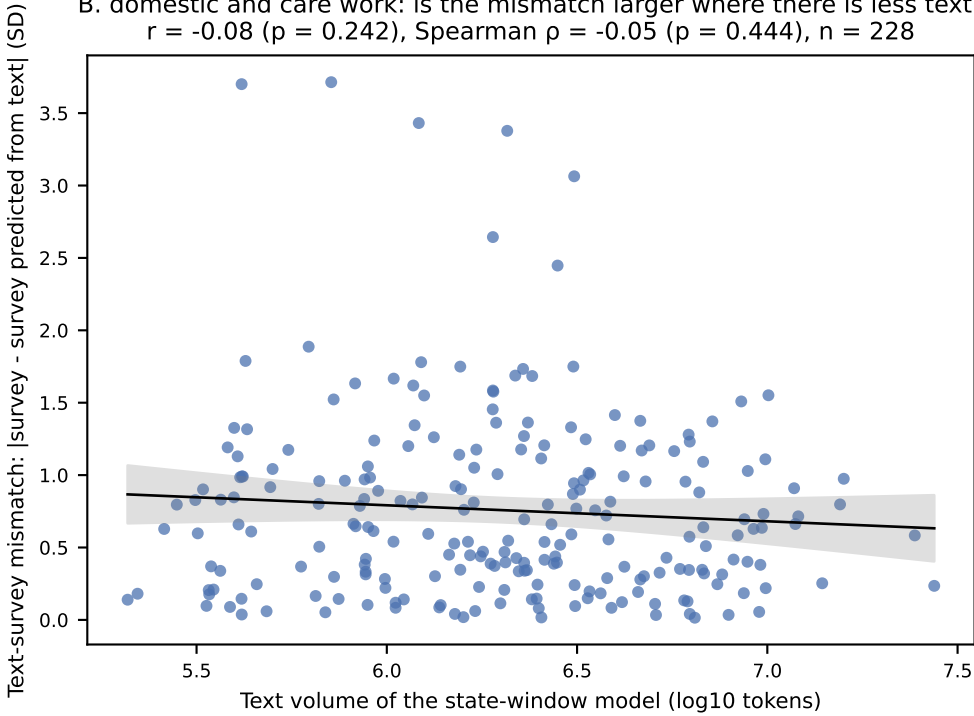

Figure 3. Measurement reliability

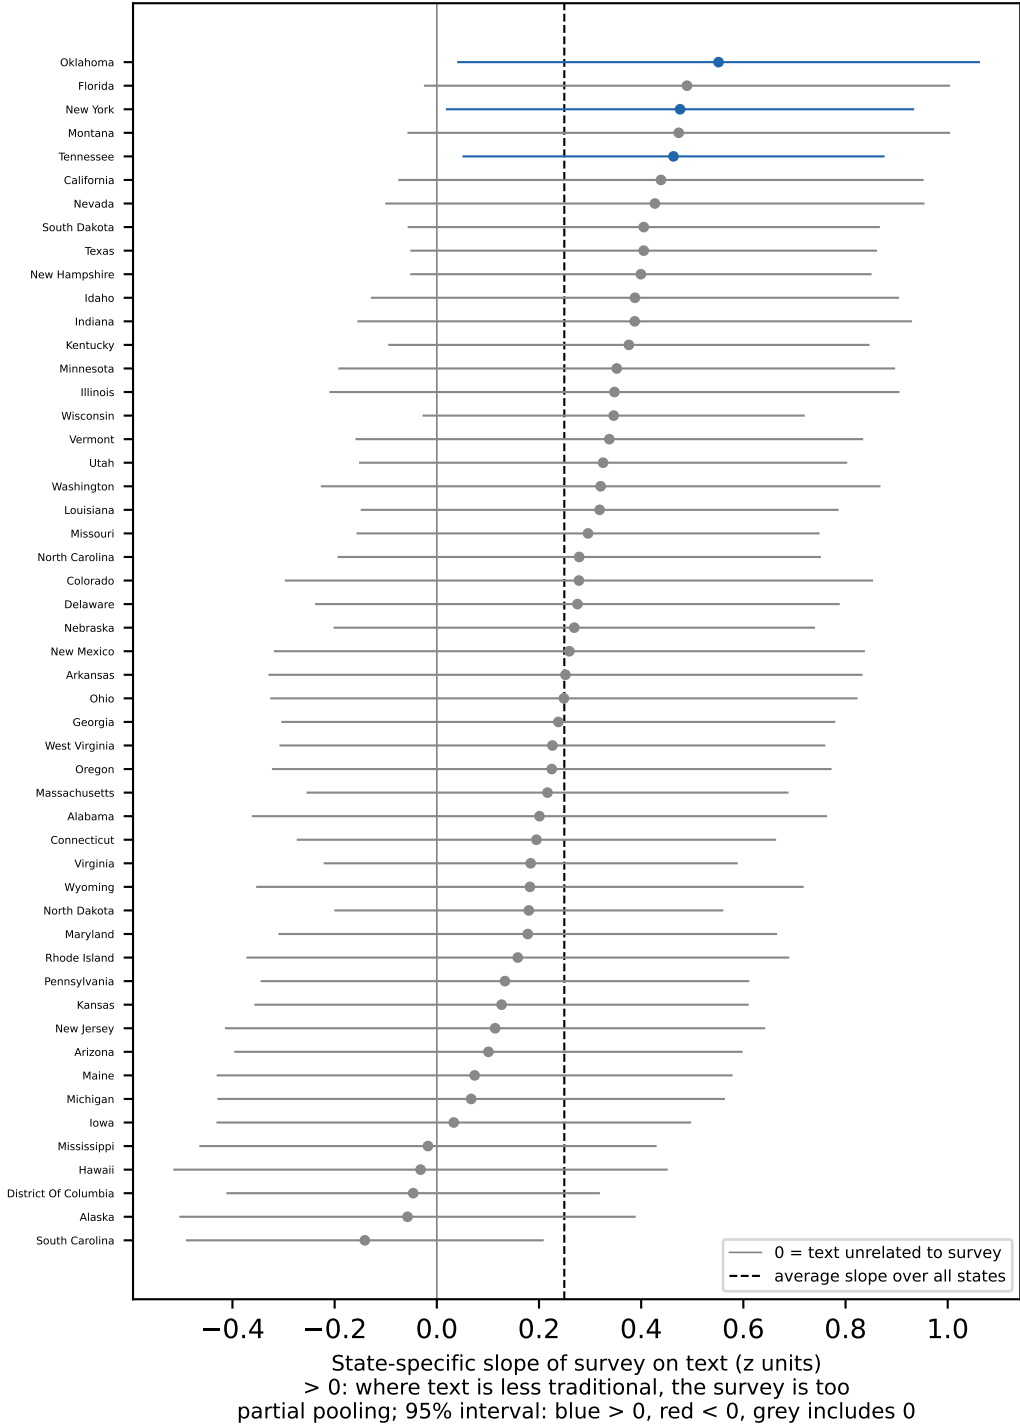

A. occupation: is the mismatch larger where there is less text?
 $r = -0.13$ ($p = 0.041$), Spearman $\rho = -0.07$ ($p = 0.259$), $n = 232$

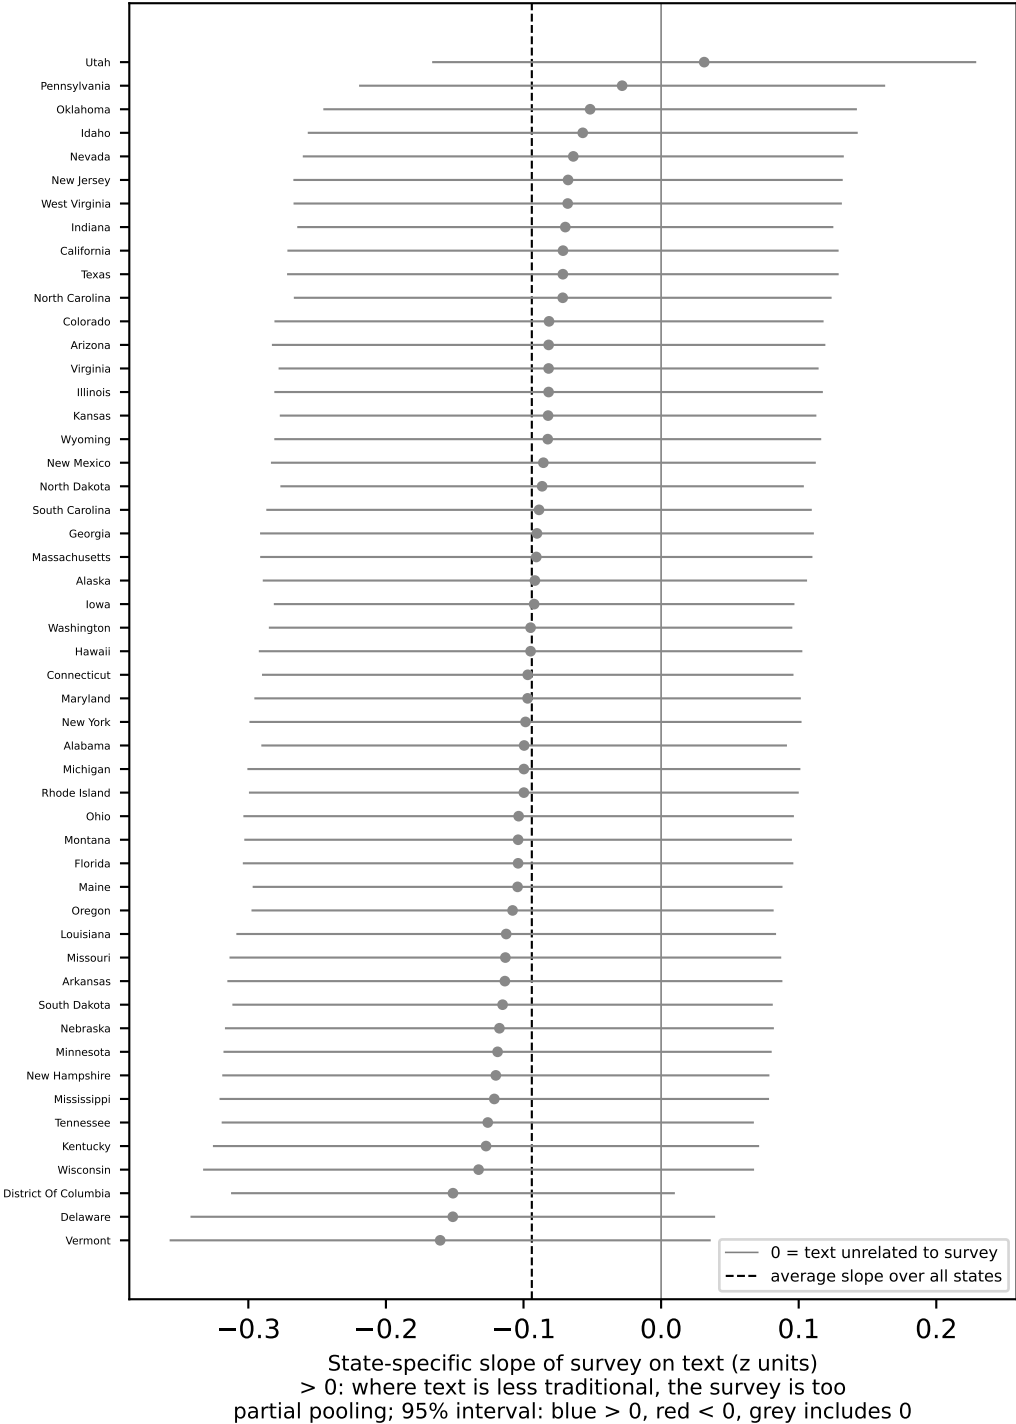

B. domestic and care work: is the mismatch larger where there is less text?
 $r = -0.08$ ($p = 0.242$), Spearman $\rho = -0.05$ ($p = 0.444$), $n = 228$

C. occupation: how closely does text track the survey in each state?

D. domestic and care work: how closely does text track the survey in each state?

C, D: one hierarchical model, slopes partially pooled toward the average; bars = 95% intervals (blue > 0, red < 0, grey includes 0), or one band when the state slopes are pooled to the average. Each state has at most 5 windows.
